## Safety

WARNING! The ACH550 adjustable speed AC drive with E-Bypass should ONLY be installed by a qualified electrician.

WARNING! Even when the motor is stopped, dangerous voltage is present at the Power Circuit terminals U1, V1, W1 and U2, V2, W2 and, depending on the frame size, UDC+ and UDC-, or BRK+ and BRK-.

WARNING! Dangerous voltage is present when input power is connected. After disconnecting the supply, wait at least 5 minutes (to let the intermediate circuit capacitors discharge) before removing the cover.
WARNING! Even when power is removed from the input terminals of the ACH550, there may be dangerous voltage (from external sources) on the terminals of the relay outputs.

WARNING! When the control terminals of two or more drive units are connected in parallel, the auxiliary voltage for these control connections must be taken from a single source which can either be one of the units or an external supply.

WARNING! The ACH550 will start up automatically after an input voltage interruption if the external run command is on.

WARNING! When the ACH550 with E-Bypass is connected to the line power, the Motor Terminals T1, T2, and T3 are live even if the motor is not running. Do not make any connections when the ACH550 with E-Bypass is connected to the line. Disconnect and lock out power to the drive before servicing the drive. Failure to disconnect power may cause serious injury or death.

Note! For more technical information, contact the factory or your local ABB sales representative.

## Use of Warnings and Notes

There are two types of safety instructions throughout this manual:

- Notes draw attention to a particular condition or fact, or give information on a subject.
- Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment. They also tell you how to avoid the danger. The warning symbols are used as follows:

今
Dangerous voltage warning warns of high voltage which can cause physical injury and/or damage to the equipment.
$\triangle$
General warning warns about conditions, other than those caused by electricity, which can result in physical injury and/or damage to the equipment.

## Installation

Study these installation instructions carefully before proceeding. Failure to observe the warnings and instructions may cause a malfunction or personal hazard.

## 全

WARNING! Before you begin read "Safety" on page 1.

WARNING! When the ACH550 with E-Bypass is connected to the line power, the Motor Terminals T1, T2, and T3 are live even if the motor is not running. Do not make any connections when the ACH550 with E-Bypass is connected to the line. Disconnect and lock out power to the drive before servicing the drive. Failure to disconnect power may cause serious injury or death.

## Application

This manual is a supplement to the ACH550-UH User's Manual and documents E-Bypass configurations.

## E-Bypass Features and Functions

The ACH550 with E-Bypass is an ACH550 AC adjustable frequency drive in an integrated UL type 1 or UL type 12 package with a bypass motor starter. The ACH550 with E-Bypass provides:

- Disconnect switch or circuit breaker with door mounted control lever. The lever can be padlocked in the OFF position (padlock not supplied).
- Bypass starter.
- Motor overload protection.
- Local operator keypad with indicating lights.
- Provisions for external control connections.
- Optional drive service switch (drive input disconnect), the functional equivalent of a three-contactor bypass arrangement.

The following shows the front view of the ACH550 E-Bypass vertical configuration, and identifies the major components.

The following shows the front view of the ACH550 E-Bypass standard configurations, and identifies the major components.

The following is a typical power diagram.

## Installation Flow Chart

The installation of E-Bypass Configurations for ACH550 drives follows the outline below. The steps must be carried out in the order shown. At the right of each step are references to the detailed information needed for the correct installation of the unit.

## Preparing for Installation (Supplement to ACH550-UH User's Manual)

## Drive Identification

## Drive Labels

To determine the type of drive you are installing, refer to either:

- Serial number label attached on upper part of the chokeplate between the mounting holes.
- Type code label attached on the

ACH550-BC-316A-4
 heat sink - on the right side of the unit cover.

| Input <br> Voltage (U1) <br> Current (IND) | $\begin{aligned} & \text { 3 Phase } 48 . .63 \mathrm{~Hz} \\ & 200 \ldots . .240 \mathrm{~V} \\ & 100 \mathrm{~A} \end{aligned}$ | $\begin{aligned} & 1 \text { Phase } 48 . . .63 \mathrm{~Hz} \\ & 200 . .240 \mathrm{~V} \\ & 100 \mathrm{~A} \end{aligned}$ | ABB Inc. <br> Made in USA with foreign parts |

| Nominal Motor Power (PND) | 400 HP | 15 HP |  |
| Short Circuit R | 100 kAIC | 100 kAIC | Mfg. Date: June 10, 2004 Org. Firmware: V.2.03B |
| UL Type 12 / IP54 |  |  | $\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\|\mid$ |

## Type Code

Use the following chart to interpret the type code found on either label.

## Ratings and Frame Size

The chart in the "Ratings" section of the ACH550-UH User's Manual lists technical specifications, and identifies the drive's frame size - significant, since some instructions in this document vary, depending on the drive's frame size. To read the Ratings table, you need the "Output current rating" entry from the type code (see above). Also, when using the Ratings tables, note that there are two tables based on the drive's "Voltage rating".

## Suitable Mounting Location (Supplement to ACH550-UH User's Manual)

In selecting a suitable mounting location for E-Bypass configurations, refer to the Technical Data in this manual for the appropriate information on:

- Branch circuit protection
- Dimensions and weights

## Installing the Wiring (Supplement to ACH550-UH User's Manual)

WARNING!

- Do not connect or disconnect input or output power wiring, or control wires, when power is applied.
- Never connect line voltage to drive output Terminals T1, T2, and T3.
- Do not make any voltage tolerance tests (Hi Pot or Megger) on any part of the unit. Disconnect motor wires before taking any measurements in the motor or motor wires.
- Make sure that power factor correction capacitors are not connected between the drive and the motor.

## Wiring Requirements

Refer to the "Wiring Requirements" Section in the ACH550 User's Manual. The requirements apply to all ACH550 drives. In particular:

- Use separate, metal conduit runs to keep these three classes of wiring apart:
- Input power wiring.
- Motor wiring.
- Control/communications wiring.
- Properly and individually ground the drive, the motor and cable shields.

## Wiring Overview (Supplement to ACH550-UH User's Manual)

## Connection Diagrams - Vertical E-Bypass

ACH550 Vertical E-Bypass units are configured for wiring access from the bottom only. The following figure shows the Vertical E-Bypass wiring connection points. Refer to the ACH550-UH User's Manual for control connections to the drive.

## Connection Diagrams - Standard E-Bypass (Wall Mounted)

ACH550 Standard E-Bypass units are configured for wiring access from the top. The following figure shows the Standard E-Bypass (wall mounted) wiring connection points. Refer to the ACH550-UH User's Manual for control connections to the drive.

## Connection Diagrams - Standard E-Bypass (R7/R8, Floor Mounted)

ACH550 Standard E-Bypass units are configured for wiring access from the top. The following figure shows the Standard E-Bypass (floor mounted) wiring connection points. Refer to the ACH550-UH User's Manual for control connections to the drive.

## Install the Line Input Wiring (Supplement to ACH550-UH User's Manual)

## Line Input Connections - Vertical E-Bypass

 ConfigurationsConnect the input power to the terminals at the bottom of the disconnect switch or circuit breaker as shown below. Also see "Connection Diagrams - Vertical E-Bypass" on page 9. Connect the equipment grounding conductor to the ground lug near the input power connection point.

Line Input Connections - Standard E-Bypass Configurations
Connect input power to the terminals of the disconnect switch or circuit breaker. Connect the equipment grounding conductor to the ground lug at the top of the enclosure. The figure below shows the connection points for Standard E-Bypass configurations. Also see "Connection Diagrams - Standard E-Bypass (R7/R8, Floor Mounted)" on page 11 for R7 or R8.

WARNING! Check the motor and motor wiring insulation before connecting the ACH550 to line power. Follow the procedure in the ACH550-UH User's Manual. Before proceeding with the insulation resistance measurements, check that the ACH550 is disconnected from incoming line power. Failure to disconnect line power could result in death or serious injury.

## Install the Motor Wiring (Supplement to ACH550-UH User's Manual)

## Motor Connections - Vertical E-Bypass Configurations

Connect the motor cables to the terminals at the bottom of the bypass section as shown in the figure below. Also see "Connection Diagrams - Vertical E-Bypass" on page 9. Connect the motor grounding conductor to the ground lug near the motor cable terminal block connection point.

## Motor Connections - Standard E-Bypass Configurations

Connect the motor cables to the output terminal block as shown in the figure below. Also see "Connection Diagrams - Standard E-Bypass (R7/R8, Floor Mounted)" on page 11 for R7 or R8. The motor grounding conductor can be connected to the ground lug near the terminal block.

## Install the Control Wiring (Supplement to ACH550-UH User's Manual)

Connect control wiring to terminal block X1 on the ACH550 control board and to terminal block X2 on the E-Bypass control board. For more information on these connections, refer to the following:

- X1 terminal block location and terminal data are defined in the ACH550-UH User's Manual.
- X2 terminal block location is illustrated in the figures starting with "Connection Diagrams - Vertical E-Bypass" on page 9.
- X2 terminal data are provided in "Basic Control Connections for Separate Drive Run \& Bypass Run Commands" on page 15.
- Basic connections are described in the following paragraphs.
- Alternate configurations using the E-Bypass macro are described in "The Bypass Application Macro" on page 32.
- On Terminal Block X1 inside the ACH550, analog inputs and outputs and additional digital input and relay output connections (Al1, AI2, AO1, AO2, DI3, DI4, DI5, DI6 and RO2) are available for use. Refer to the ACH550-UH User's Manual for information about control connections on Terminal Block X1.

Note! The E-Bypass control circuitry uses inputs and outputs DI1, DI2, RO1 and RO3 (X2:7...X2:14). These inputs and outputs are not available for any other purpose and must not be reconfigured.

## Basic Connections

The figure below shows the basic control connections for use with the E-Bypass macro. These connections are described in the following paragraphs.
In typical installations, only serial communications and analog input wires connect to the ACH550 terminal block, with other control connections made on the E-Bypass control board.

## Basic Control Connections for Separate Drive Run \& Bypass Run Commands

| 15 | Digital Input 3 |
| :--- | :--- |
| 16 | Digital Innut 4 |
| 17 | Digital Input 5 |
| 18 | Digital Input 6 |

## ACH550 Drive

| Parameter Number | Description | Setting |
| :---: | :---: | :---: |
| 1001 | EXTERNAL 1 COMMANDS | 1 (DI1) |
| 1002 | EXTERNAL 2 COMMANDS | 1 (DI1) |
| 1601 | RUN ENABLE | 2 (DI2) |
| 1401 | RELAY OUTPUT 1 | 7 (STARTED) |
| 1403 | RELAY OUTPUT 3 | 3 (FAULT (-1)) |

## Keypad Control Tests

Apply power to the E-Bypass unit. The display should show the operating status of the drive. If the motor is a standard $208 \mathrm{~V}, 60 \mathrm{~Hz}$ motor connected to a 208 V drive or a $480 \mathrm{~V}, 60 \mathrm{~Hz}$ motor connected to a 480 V drive, the default parameter settings should be suitable for the initial tests described below. If the motor's rating is not 208 V or $480 \mathrm{~V}, 60 \mathrm{~Hz}$, the MOTOR NOM VOLT and MOTOR NOM FREQ parameters will need to be properly set before proceeding. Refer to the ACH550-UH User's Manual and set the parameters as required.

The only macro that provides the proper configuration settings by default is the E-Bypass macro. If any other macro is used, that macro should be selected after completing the initial tests. When using any other macro the following parameter values must be set or portions of the E-Bypass will not function properly:

- Parameter 1001 must be set to "DI1"
- Parameter 1002 must be set to "DI1"
- Parameter 1601 must be set to "DI2"
- Parameter 1401 (RO1) must be set to "Started"
- Parameter 1403 (RO3) must be set to "Fault (-1)"

Refer to the ACH550-UH User's Manual for additional information.

## Test: Motor Disconnected from the ACH550 with E-Bypass

After setting the Start-up Data parameters, test and become familiar with the operation of the ACH550 Drive with E-Bypass without the motor connected as follows:

1. Disconnect and lock out power to the E-Bypass unit, wait at least five minutes after disconnecting power.
2. Disconnect the motor from the E-Bypass unit.
3. Apply power to the E-Bypass unit by turning on the branch circuit disconnect device and the bypass disconnect switch or circuit breaker.
4. The ACH550 Control Panel display should be illuminated. On the bypass keypad, the Ready LED and Enable LED should be illuminated. If the Enable LED is not illuminated, check to see that closed contacts or jumpers connect terminal X2:2 and X2:3, on the bypass control board, to terminal X2:15.
5. Either the Drive Selected or Bypass Selected LED should be illuminated. Pressing the Drive Select or Bypass Select key should switch the bypass back and forth between the Drive mode and the Bypass mode as indicated by the LEDs above each button. Check that the bypass keypad switches the system between modes. Leave the system in the Bypass mode when proceeding to the next step.
6. Check to see that pressing the Auto key on the bypass keypad causes the Auto LED to be illuminated, pressing the Hand key causes the Hand LED to be illuminated and pressing the OFF key causes either the Hand or Auto LED to go off. Leave the Hand and Auto LEDs off when proceeding to the next step.
7. For Steps 8 through 13 Parameter 9904 must be set to "Scalar: Freq". After successful completion of Step 12, Parameter 9904 may be set to "Vector: Speed" if
very specific application requirements make it necessary to use this type of motor control. Operation using the "Vector: Speed" setting is unnecessary for control of almost all fan and pump applications. Refer to the ACH550-UH User's Manual for details on setting parameters.
8. Press the Drive Select key on the bypass keypad. The Drive Select LED should be illuminated.
9. Press the HAND key on the ACH550 keypad. Note that the bottom line of the display indicates "HAND" and "RUN" and a Right Arrow. The Drive Run LED on the Bypass keypad should be illuminated.
10. Press the UP arrow. Note that the reference frequency indication in the top line of the display increases from " 0.0 Hz ." The large actual output frequency indication in the center line of the display should also increase from " 0.0 Hz ."
11. In the top line of the display, the output current indication should indicate " 0.0 A " and the torque indication should indicate " $0 \%$."
12. Press the DOWN arrow until the frequency indications return to " 0.0 Hz ."
13. Press the OFF key. Note that the bottom line of the display indicates "Off."

If the ACH550 Drive and E-Bypass operate according to these steps, disconnect and lock out power to prepare for the next test.

WARNING! Wait at least five minutes after disconnecting power from the drive before you attempt to service the drive. Bus capacitors in the intermediate DC circuit must discharge before servicing the drive. Using a meter rated for 1000 VDC, check for zero volts at:

- Terminals BRK+ and BRK- (frame size R1/R2)
- Terminals UC+ and UC- (frame size R3...R8).

If the drive does not operate according to these steps, refer to the ACH550-UH User's Manual.

## Test: Motor Connected to the E-Bypass

After successfully testing the drive with the motor disconnected, continue testing the drive as follows:

1. Disconnect and lock out power to the E-Bypass unit.
2. Connect the motor to the output terminals.

## 名

CAUTION: If the Fireman's Override (Override 1) input contact is closed, the motor will start across the line as soon as power is applied. If the Safety Interlock and Run Enable input contacts are closed and the Bypass Override (Override 2) input contact is closed, the motor will start across the line as soon as power is applied.

If the Start/Stop, Safety Interlock and Run Enable input contacts are closed and the system is in the Bypass mode and in either Hand or Auto, the motor will start across the line as soon as power is applied.

If the Start/Stop, Safety Interlock and Run Enable input contacts are closed and the system is in the Drive mode with the drive in either Hand or Auto mode, the motor will start on the drive as soon as power is applied.

In order to prevent the motor from starting, the system should be in the Drive mode and the drive should be OFF when the power is disconnected at the end of the previous series of tests with the motor disconnected.

In order to prevent the motor from running without disconnecting the motor, open the Run Enable and Safety Interlock contacts on bypass control board terminals X2:2, X2:3 and X2:4 before applying power. Set the bypass to Drive mode and the drive to OFF.
3. Apply power to the E-Bypass unit.
4. Press the Hand key on the ACH550 control panel.

CAUTION: Check motor rotation direction as soon as the motor begins to move. If motor does not rotate in the correct direction, shut down the drive, disconnect and lock out power to the drive and wait five minutes. Swap any two motor output wires (T1, T2, and T3). Incorrect motor rotation direction may cause equipment damage.
5. Slowly increase the output frequency by pressing the UP ARROW key. Verify that motor speed varies as frequency varies.
6. Increase the speed to 60 Hz or the highest safe operating speed.
7. Measure the output current in all three phases. The current should be balanced, and should not exceed the motor or drive rating.
8. Press the OFF key on the ACH550 control panel. The motor should stop.

CAUTION: Check the motor rotation direction in bypass.
Press the OFF key and then the Bypass Select key on the bypass keypad.
Press the Hand key and then quickly press the OFF key to "bump" the motor. If the motor turns in the wrong direction, tag out/lock out, then swap any two input power leads at the disconnect switch. Do not swap the motor leads.

If the drive does not operate according to these steps, refer to the ACH550-UH User's Manual.

If the drive operates according to these steps, your ACH550 with E-Bypass is ready to use with preset or modified macro settings. Refer to the ACH550-UH User's Manual for programming instructions.
9. Perform the Keypad Control Test before connecting the motor. Refer to "Keypad Control Tests" on page 16.

## Check E-Bypass Jumpers, Switches and Pots

The settings described in this section are factory set and, for most situations, do not require adjustment. However, it is a good practice to review these settings to confirm that they are appropriate for the configuration installed.

## Adjustment Locations

The figure below shows the locations of the jumpers, DIP switch and potentiometers on the E-Bypass control board. The functions and settings of these items are explained in the following paragraphs.

## DIP Switch Settings

The DIP switch is used to configure the bypass overload protection, select the Mode / Override relay's function and enable the automatic bypass feature. Match the DIP Switch Codes to your drive model using the following tables, as appropriate.
208... 240 Settings

| $\mathbf{2 0 8} \mathbf{- \mathbf { 2 4 0 } \text { Volt, Codes for Overload Trip Current DIP Switch }}$ |  |  |  |
| :---: | :---: | :---: | :---: |

| 5 | RESERVED (OFF) |  |  |  |  |  |  |  |
| 6 | OFF | OFF | OFF | OFF | ON | ON | ON | ON |
| 7 | OFF | OFF | ON | ON | OFF | OFF | ON | ON |
| 8 | OFF | ON | OFF | ON | OFF | ON | OFF | ON |

Default settings in (parentheses).

## Output Contactor Control

In the unlikely event of failure in the bypass control electronics, the user can engage the drive output contactor without the control electronics by moving jumper J2 to the Output Contactor position - see "Adjustment Locations" on page 19. When the jumper is in the Output Contactor position, the Drive contactor is energized and the Bypass contactor is de-energized. The contactors, and therefore the system, are not controlled by the bypass electronics when jumper J2 is in the Output Contactor
position. The system is incapable of Bypass or Override operation in this configuration.

## Overload Trip Current Adjustment Potentiometer

The overload protection trip current must be adjusted to the motor nameplate current using the P1 adjustment potentiometer located in the lower right hand area of the bypass control board - see "Adjustment Locations" on page 19. The following table shows the trip currents for the various frame sizes for potentiometer settings of 10 to 100.

| Potentiometer <br> Setting | Overload Trip Current (Values in Amps) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Switch Code |  |  |  |  |  |  |  |  |
|  | A | B | C | D | E | F | G | H |  |
| 10 | 1.2 | 2.5 | 3.8 | 7.5 | 10.4 | 15.5 | 30.0 | 48.8 |  |
| 20 | 2.4 | 5.0 | 7.6 | 15.0 | 20.8 | 31.0 | 60.0 | 97.6 |  |

## Underload Trip Current Adjustment Potentiometer

The underload protection trip current must be adjusted to a percentage of the motor nameplate current using the P2 adjustment potentiometer located in the lower right hand area of the bypass control board - see "Adjustment Locations" on page 19. Potentiometer settings are adjustable from 0 to $100 \%$ of the P1 (overload trip) setting. The default setting is $0 \%$ which effectively removes the underload protection trip feature from the system.

## Circuit Breaker Settings

On an ACH550 E-Bypass with output ratings above 120 amps , the circuit breaker has adjustable switch settings for instantaneous and overload current protection. The factory default settings are practical for most applications. Refer to the "ABB SACE Instruction Sheet" (supplied with floor mounted units) for additional information on the adjustment of these settings.

## Start-up

## Bypass Control Panel Features

Note! For normal operation with the E-Bypass, place the ACH550 control panel in the Auto mode.

The following figure shows the bypass control keypad and identifies the keys and LED indicating lights. The functions of the various keys and LEDs are described in the following paragraphs.

Ready LED
The Ready LED is illuminated when the disconnect switch or circuit breaker is closed and power is applied to the ACH550 and bypass.

## Enable LED

The Enable LED is illuminated under the following conditions:

- Both the Safety Interlock and Run Enable contacts are closed.
- The Safety Interlock contact is closed with no Start command present.

The Enable LED flashes, if the Run Enable contact is open and when the Safety Interlock contact is closed and a Start command is present.
The Enable LED is not illuminated when the Safety Interlock contact is open.

## Drive Run LED

The Drive Run LED is illuminated green when the ACH550 drive is running.

## Bypass Fault LED

The Bypass Fault LED indicates the status of the bypass overload/underload protection. The LED is red when the bypass has tripped on an overload/underload or the bypass control board has faulted.

## Drive Selected LED

The Drive Selected LED is illuminated green when the ACH550 drive has been selected as the power source for the motor.

## Bypass Selected LED

The Bypass Selected LED is illuminated green when the E-Bypass has been selected as the power source for the motor.

## Drive Fault LED

The Drive Fault LED is illuminated red when the motor or drive protection functions have shut down the ACH550.

## Bypass Run LED

The Bypass Run LED is illuminated green when the motor is running in bypass.

## Automatic Transfer LED

The Automatic Transfer LED is illuminated green to indicate the system has automatically transferred to Bypass after a Drive fault.
The Automatic Transfer LED flashes green to indicate the system has been placed in an Override condition.

## Auto LED

The Auto LED is illuminated green when the Auto Start contact has been selected as the means for starting and stopping the motor in the bypass mode.

## Hand LED

The Hand LED is illuminated green when the motor has been started manually in the bypass mode.

## Drive Select Key

The Drive Select key selects the ACH550 drive as the power source for the motor.

## Bypass Select Key

The Bypass Select key selects the bypass as the power source for the motor.

## Reset Key

The Reset key resets the bypass fault. It may take several minutes before the bypass can be reset after an overload trip.

## Auto Key

The Auto key selects the Auto Start contact as the means for starting and stopping the motor in the bypass mode.

## Hand Key

The Hand key can be used to manually start the motor when the bypass has been selected as the power source for the motor.

OFF Key
The OFF key can be used to manually stop the motor if the motor has been running on bypass power.

## Operating Modes

Drive Mode
Under normal conditions the system is in the Drive mode. The ACH550 drive provides power to the motor and controls its speed. The source of the drive's start/ stop and speed commands is determined by the Auto or Hand mode selection of the drive's keypad. Commands come from the control terminals (or serial communication) when the Auto mode has been selected or from the drive keypad when the Hand mode has been selected. The user can normally switch to the Drive mode by pressing the Drive key on the bypass keypad.

## Bypass Mode

In the Bypass mode, the motor is powered by AC line power through the bypass contactor. The source of the bypass start/stop commands is determined by the Auto or Hand mode selection of the bypass' keypad. Commands come from the control terminals when the Auto mode has been selected or from the bypass keypad when the Hand mode has been selected. The user can normally switch to the Bypass mode by pressing the Bypass key on the bypass keypad. Alternative methods of bypass control called Overrides are also available. Refer to the following descriptions of the Override modes.

## Fireman's Override Mode

In the Fireman's Override (Override 1) mode, the motor is powered by AC line power through the bypass contactor. The source of the start command is internal and unaffected by external stop commands. The user can switch to the Fireman's Override mode by closing the Fireman's Override input contact. When the Fireman's Override input contact is closed, the system is forced to bypass and runs the motor. The Automatic Transfer LED flashes green when the system is in override. While in Fireman's Override the system does not respond to any other inputs including overloads, faults, safeties and enables. Fireman's Override is designed for "Run to Destruction" operation. Normally when the Fireman's Override input contact is switched from closed to open, the system returns to the operating mode that existed prior to entering Override and can be controlled using the Drive and Bypass keys. The exception to this is when the Bypass Override (Override 2) input contact is closed, in which case the system switches to Bypass Override mode.

## Bypass Override Mode

In the Bypass Override (Override 2) mode, the motor is powered by AC line power through the bypass contactor. The source of the start command is internal and unaffected by external stop commands. The user can switch to the Bypass Override mode by closing the Bypass Override input contact. When the Bypass Override input
contact is closed, the system is forced to bypass and does not respond to the Drive and Bypass keys. The Automatic Transfer LED flashes green when the system is in override. While in Bypass Override the system responds to bypass overloads, faults, safeties and enables. Normally when the Bypass Override input contact is switched from closed to open, the system switches to the Drive mode and can be controlled using the Drive and Bypass keys.The exception to this is when the Fireman's Override (Override 1) input contact is closed, in which case the system remains in Fireman's Override mode.

## Hand Mode

When the system is in the Bypass mode, the operator can manually start the motor by pressing the Hand key on the bypass keypad. The motor will run and the Hand LED will be illuminated green. In order to run the motor, the Safety Interlock and Run Enable contacts must be closed (green Enable LED) and any bypass fault must be reset.

## Auto Mode

In the Auto mode the bypass start/stop command comes from the Start/Stop input terminal on the bypass control board. The Auto mode is selected by pressing the Auto key on the bypass keypad. The Auto LED is illuminated green when the bypass is in the Auto mode. If the system is in the Bypass mode, the motor will run across the line if the Auto mode is selected, the Start/Stop, Safety Interlock and Run Enable contacts are closed and any bypass fault is reset.

## Off Mode

If the motor is running in the Bypass mode, the operator can manually stop the motor by pressing the OFF key. The Hand or Auto LED will go out. The motor can be restarted by pressing the Hand key or the bypass can be returned to the Auto mode by pressing the Auto key. If the system is in the Drive mode, pressing the OFF key will take the bypass out of the Auto mode, but will not affect motor operation from the drive. If the system is switched to the Bypass mode, a motor that is running will stop.

## Bypass/Drive Mode Transfers

If the ACH550 is in the Auto mode and the motor is running in the Drive mode, the motor will transfer to bypass operation and continue running if the system is switched to the Bypass mode and the bypass is in the Auto mode with the Start/Stop Input contact closed.

If the motor is running in the Bypass mode, the motor will transfer to drive operation and continue running if the system is switched to the Drive mode and the drive is in the Auto mode with the Start/Stop Input contact closed.

## Starting the Motor on Application of Power

If the Safety Interlock and Run Enable Input contacts are closed and the system is in the Bypass mode and in either the Hand or Auto mode, the motor will start across the line as soon as power is applied. If the system is in the Drive mode with the drive in the Auto mode, the motor will start on the drive as soon as power is applied.

## Automatic Transfer Option

When the Automatic Transfer option is selected, the motor is automatically transferred to line power if the drive trips out on a protective trip. If automatic restart
has been enabled in the drive, the drive will attempt to automatically restart before the motor is transferred to line power. The Automatic Transfer option is selected by setting a configuration switch on the bypass control board. See "Check E-Bypass Jumpers, Switches and Pots" on page 19. The Automatic Transfer LED is illuminated green once the system has automatically transferred to bypass operation.

## Output Contactor Control

In the unlikely event of failure in the bypass control electronics, the user can engage the drive output contactor without the control electronics by using a configuration jumper on the bypass control board. See "Output Contactor Control" on page 22.

## Bypass Control Board Inputs and Outputs

The E-Bypass control board has five relay contact (digital) inputs, six relay outputs and one digital output that are available for connection to external control circuits. The internal 24VDC supply is normally used in conjunction with the relay contact inputs. Use of an external 110 VAC power supply requires re-configuring Jumper J3. Care should be taken when using external supply voltages so as not to damage the drive and bypass electronics. The input and output functions are described below. Refer to "Installation" for additional information and connection instructions.

## Relay Contact Inputs

## Start/Stop

The Start/Stop input is connected to a normally open contact that starts and stops the system. When the E-Bypass is in the Drive mode and the ACH550 is in the Auto mode, the Start/Stop input contact controls the motor by starting and stopping the ACH550 drive. When the E-Bypass is in the Bypass mode and the Auto LED is illuminated green, the Start/Stop input contact controls the motor by controlling the bypass contactor.

Run Enable
The Run Enable input is connected to the series combination of any external normally closed permissive contacts, such as damper end switches, that must be closed to allow the motor to run. If any of these external contacts are open while a Start command is present, the Enable LED will flash and the motor is prevented from running.

## Safety Interlock

The Safety Interlock input is connected to the series combination of any external normally closed interlock contacts, such as Firestat, Freezestat, and high static pressure switches - switches that must be closed to allow the motor to run. If any of these external contacts are open, the Enable LED is not illuminated, the drive output contactor, bypass contactor, and System Started relay are de-energized preventing the motor from running.

## Fireman's Override (Override 1)

The Fireman's Override (Override 1) input can be connected to an external contact that is closed to select the Fireman's Override mode. See "Fireman's Override Mode" on page 26 for a description of this mode.

## Bypass Override (Override 2)

The Bypass Override (Override 2) input can be connected to an external contact that is closed to select the Bypass Override mode. See "Bypass Override Mode" on page 26 for a description of this mode.

## Relay Contact Outputs

## Bypass Fault

The Bypass Fault relay is energized during normal operation. The Bypass Fault relay is de-energized when a bypass fault has occurred or when the bypass motor overload/underload protection has tripped.

## System Run

The System Run relay is energized when the E-Bypass System is running. The System Run relay provides an output when the motor is running whether powered by the ACH550 drive or the bypass.
Separate Drive Run and Bypass Run contacts can be created by using the common (C) contact of the System Run relay and connecting the normally open (NO) contact of the System Run relay to the common (C) contact of the Mode / Override relay. To do this the Mode / Override relay must be configured for Mode relay operation. See "Check E-Bypass Jumpers, Switches and Pots" on page 19. The normally closed (NC) contact of the Mode relay becomes the Drive Run contact and the normally open (NO) contact of the Mode relay becomes the Bypass Run contact This configuration provides outputs that are closed when the motor is running. See "The Bypass Application Macro" starting on page 32.

## System Started

The System Started relay is energized when the E-Bypass system is started. Three conditions must be met in order for the relay to energize.

- A Start command must be present,
- The Safety Interlock input contact must be closed and
- There can be no fault present in the system.

The Start command can come from the bypass control board terminal block, the ACH550 keypad, the bypass keypad, or serial communications, depending on the operational mode selected. The System Started relay is ideal for use in damper actuator circuits, opening the dampers only under those conditions where the system is preparing to run the motor. Closing the dampers if the safeties open, the system faults, or when a Stop command is issued.

## Mode/Override

The Mode / Override relay is a configurable relay. The function of the relay is selectable between Mode and Override operation. If the Mode / Override relay is configured for Mode operation (Default), the relay is energized when the Bypass mode is selected and de-energized when the Drive mode is selected. If the Mode / Override relay is configured for Override operation, the relay is energized when the Override mode is selected and de-energized in all other modes. See "Check E-Bypass Jumpers, Switches and Pots" on page 19.

## Drive Fault

The Drive Fault relay is energized during normal operation. The Drive Fault relay is de-energized when an ACH550 drive fault has occurred.

## Hand/Off/Auto

The Hand/Off/Auto relay is energized when the bypass is in the Auto mode and deenergized in the Hand mode and when the bypass is Off. In the Auto mode the bypass start/stop command comes from the Start/Stop input terminal on the bypass control board.

## Digital Output

## Safety Interlock

The Safety Interlock output is active when the Safety Interlock Input contact is closed. The Safety Interlock output is available for customer connection and routing through the ACH550 drive. User's can select from a variety of optional communication protocols to monitor the Safety Interlock status through the ACH550 digital inputs. Refer to the ACH550-UH User's Manual and the appropriate communications manual for additional information about monitoring ACH550 digital inputs.

## ACH550 Drive Inputs and Outputs

Some of the ACH550 inputs and outputs are pre-wired to the bypass control board and not available for external use. The inputs and outputs that are not pre-wired are available for external use by connecting directly to the terminals in the ACH550. The pre-wired and available inputs and outputs are described below. Refer to the ACH550-UH User's Manual for additional information about the inputs and outputs. See also "Installation" for additional information and connection instructions.

The ACH550 has two relay outputs that are pre-wired to the bypass control board. These two relay outputs are used to provide the System (Drive) Started and Drive Fault outputs that are described above.

Two of the ACH550's digital inputs, the Auto Mode Start/Stop input and the Run Enable input are also pre-wired to the bypass control board. These two digital inputs are coordinated with the Start/Stop and Run Enable inputs that control the motor in both the Drive and Bypass modes of operation.

Note! The E-Bypass will not work properly if the Drive relay outputs RO1 and RO3 or the Drive digital inputs DI1 and DI2 are reassigned by changing ACH550 configuration settings. The only macro that, by default, provides the proper configuration settings is the E-Bypass macro. If any other macro will be used, see "The Bypass Application Macro" on page 32.

Four of the digital inputs of the ACH550 are available for routing E-Bypass outputs (digital and relay outputs) through the ACH550 drive. Users can select from a variety of communication protocols to monitor the E-Bypass status through the ACH550 digital inputs. The digital inputs of the ACH550 are also available for selecting constant speeds or providing Speed Increase and Speed Decrease inputs. The
functions of these inputs is determined by the ACH550 macro selection. Refer to the ACH550-UH User's Manual for additional information.

The ACH550 Auto Mode External Reference input is an analog input that sets the operating speed when the ACH550 HVAC macro is selected and the drive is in the Auto mode. When HVAC PID Control is selected, analog inputs are used for receiving the transducer feedback "actual" signal. Refer to the ACH550-UH User's Manual for additional information.

The Output Frequency analog output of the ACH550 provides a 4 to 20 mA signal proportional to the drive output frequency or motor speed.

## The Bypass Application Macro

The following figures show a variety of configurations and connections using the Bypass Macro.
Basic Control Connections for Separate Drive Run \& Bypass Run Commands

## Technical Data

## Input Power Connections (Supplement to ACH550-UH User's Manual)

## Branch Circuit Protection

Input power is connected to the ACH550 with E-Bypass through a door interlocked disconnect switch or circuit breaker. Neither of these inputs are fused. The branch circuit that provides power to the ACH550 with E-Bypass must include appropriate motor branch circuit protective devices to provide short circuit and ground fault protection for the motor in the bypass mode.

When connected to a 480 VAC power source, the ACH550 with E-Bypass with the circuit breaker option is suitable for use on a circuit capable of delivering not more than 20,000 RMS symmetrical amperes (14,000 RMS symmetrical amperes for the 3 and 5 HP models). When connected to a 240 VAC power source, the ACH550 with E -Bypass with the circuit breaker option is suitable for use on a circuit capable of delivering not more than 50,000 RMS symmetrical amperes.

## Fuses

NOTE! Although fuses listed are similar in function to fuses listed in the ACH550-UH User's Manual, physical characteristics may differ. Fuses from other manufacturers can be used if they meet the ratings given in the table. The fuses recommended in the table are UL recognized.

Drive input fuses are provided to disconnect the drive from power in the event that a component fails in the drive's power circuitry. Since fast-acting fuses are provided, the branch circuit protection will not clear when the drive input fuses blow. If the drive input fuses blow, the motor can be switched to Bypass without replacing fuses or resetting a circuit breaker. The drive's electronic protection circuitry is designed to clear drive output short circuits and ground faults without blowing the drive input fuses. Drive input fuse specifications are listed in the following tables.
208... 240 Volt Fuses

## Line Reactor

The ACH550 E-Bypass may contain optional input line reactors to provide additional input impedance on the VAC line. This impedance is in addition to the approximate $5 \%$ input impedance provided by internal reactors that are standard in the drive.

## Drive's Power Connection Terminals

The following tables list power and motor cable terminal sizes for connections to an input circuit breaker or disconnect switch, a motor terminal block and ground lugs. The tables also list torque that should be applied when tightening the terminals.

Vertical Enclosure Terminals, 208... 240 Volt Units

| 208... 240 Volt |  | Frame Size | Maximum Wire Size Capacities of Power Terminals |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Motor Connections (Supplement to ACH550-UH User's Manual)

## Motor Terminals

See "Drive's Power Connection Terminals" above.

## Bypass Contactors

The bypass circuit available with the ACH550 E-Bypass includes two contactors. One contactor is the bypass contactor (2M) that can be used to manually connect the motor directly to the incoming power line in the event that the ACH550 is out of service. The other contactor is the ACH550 output contactor (1M) that disconnects the ACH550 from the motor when the motor is operating in the Bypass mode. The drive output contactor and the bypass contactor are interlocked to prevent "back feeding," applying line voltage to the ACH550 output terminals.

## Motor Overload Protection

In the Drive mode, motor overload protection is provided by the ACH550.
In the Bypass mode, motor overload protection is provided by the bypass control board.

$\triangle$
WARNING: If power is applied and the switches and contacts in the control circuit are commanding the motor to run, the motor will start as soon as the overload protection is reset.
Use caution when resetting the overload protection to make sure it is safe to start the motor.

## E- Bypass Control Panel Connections (Supplement to ACH550-UH User's Manual)

Control cable requirements for connections to the E-Bypass control panel (X2) are the same as those described for the ACH550 control panel (X1). Refer to the ACH550 User's Manual.

Control Panel Connection Specifications

| Control Connection Specifications |  |
| :---: | :--- |
| Digital Inputs | Digital input impedance $1.5 \mathrm{k} \Omega$. Maximum voltage for digital inputs is 30 V. |
| Relays | - Max. contact voltage: $30 \mathrm{~V} \mathrm{DC}, 125 \mathrm{~V} \mathrm{AC}$ |
| (Digital Outputs) | - Max. switching current: $8 \mathrm{~A}, 24 \mathrm{~V} \mathrm{DC;} 0.4 \mathrm{~A}$ at 125 V AC |
|  | - Max. continuous current: 2 A rms |

WARNING! Relay coils generate noise spikes in response to steps in applied power. To avoid drive damage from such spikes, all AC relay coils mounted across control panel inputs require R-C snubbers, and all DC relay coils mounted across control panel outputs require diodes - see figure.

## Control Panel Terminals

The following table provides specifications for the E-Bypass's control terminals

| Frame Size | Control |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Maximum Wire Size |  | Torque |  |
|  | $\mathbf{m m}^{\mathbf{2}}$ | AWG | $\mathbf{N m}$ | $\mathbf{l b - f t}$ |
| All | $0.12 \ldots 2.5$ | $26 \ldots 14$ | 0.4 | 0.3 |

## Dimensions and Weights (Supplement to ACH550-UH User's Manual)

## Mounting Dimensions

The following diagram and tables provide mounting point dimensions for wall mounted cabinets.

Standard E-Bypass

Vertical Enclosure, R1...R4

## Weights

The following table lists typical maximum weights for each frame size. Variations within each frame size (due to components associated with voltage/current ratings, and options) are minor.

Vertical Enclosure, R1...R4

| Enclosure | Weight |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | R1 |  | R2 |  | R3 |  | R4 |  |  |
|  | kg | lb. | kg | lb. | kg | lb. | kg | lb. |  |
| IP 21 / <br> UL type 1 | 18 | 40 | 23 | 50 | 51 | 112 | 59 | 131 |  |

Standard Enclosure, R1...R6

| Enclosure | Weight |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | R1 |  | R2 |  | R3 |  | R4 |  | R5 |  | R6 |  |

Outside Dimensions - R7...R8
Outside dimensions for the R7 and R8 cabinets are defined below.

| Outside Dimensions by Frame Size |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Enclosure | Ref. | R7 |  | R8 |  |
|  |  | $\mathbf{m m}$ | in | $\mathbf{m m}$ | in |
| IP 21 / UL type 1 | $\mathbf{W}$ | 806 | 31.7 | 806 | 31.7 |
|  | $\mathbf{H}$ | 2065 | 81.3 | 2065 | 81.3 |
|  | $\mathbf{D}$ | 659 | 25.9 | 659 | 25.9 |
| IP 54 / UL type 12 | $\mathbf{W}$ | 806 | 31.7 | 806 | 31.7 |
|  | $\mathbf{H}$ | 2377 | 93.6 | 2377 | 93.6 |
|  | $\mathbf{D}$ | 659 | 25.9 | 659 | 25.9 |

## Applicable Standards

The E-Bypass configuration conforms to all standards listed for the ACH550-UH.
