

# Can you maximise the performance of your low voltage breakers? Definitely.

The service teams for ABB's low voltage breakers and systems focus on keeping your breakers in optimum condition, ensuring maximum reliability and up-time. ABB's retrofit service improves the electrical and mechanical performance of breakers by replacing obsolete components with modern equivalents. All of which is carried out using special replacement kits or bespoke engineered solutions. A retrofit preserves the existing switchboard's condition and reduces the breakers' downtime. Utilising life cycle management practices, installations can have their serviceable lifespans significantly increased. With the combination of new concept smart connected apparatus and retrofitting kit, ABB covers all customer needs in the new Industry 4.0 era.
