1

Distribution systems with cables laid along the floor are, by far, the most widespread solution in modern office buildings and, in general, the most advanced tertiary activities.

In particular it is evident how radically the use of offices has changed and more generally, the structure in which defined activities in the tertiary sector are carried out.

The principal elements of this metamorphosis are well known: most importantly the need for adaptability and the rational use of space, but also the presence of more services alongside the electricity supply (telephone, data processing, automatic plant management, auxiliary services), reduction in electricity consumption and, last but not least, an improvement in the environment in terms of the ergonomic aspects of the workplace as well as the greater comfort and improved appearance of rooms.

These are needs that are also found more and more in other sectors, wherever there is a requirement to use space to its greatest advantage, and to respond, almost in real-time, to the changing requirements of the market.

Compared to some years ago, all of this has inevitably influenced and modified the way technological systems in buildings are planned and implemented, particularly those concerning the transfer of signals and various kinds of electrical elements by cable.

As an efficient and rational solution to satisfy all these requirements, ABB proposes advanced underfloor distribution systems

which integrate perfectly with junction and floor boxes. Due to their characteristics which enable the distribution of various services, by cable, to every part of the room and with a configuration easily modifiable to any requirement, they are by far the most widespread solution in modern office buildings and, in general, the most advanced tertiary activities.

Floor trunking systems

ABB proposes two underfloor distribution systems: Scattoplast and Undernet.

The Scattoplast system is suitable for traditional floors and is therefore incorporated in the floor itself, but it can also be installed in raised floors, while the Undernet system is designed for raised floors and false ceilings.

Not only is underfloor installation flexible, making reconfiguration of space according to the different uses of the room easy and economical, but it also has further advantages in terms of maintenance and ease of modification of the plant itself after implementation.

FLSP9001

To achieve integration and to ensure complete plant implementation, the Scattoplast system can be easily connected both to the Underfloor system and to above-floor trunking by junction boxes also supplied by ABB. Scattoplast components conform to the CEI 64-8 Standard.

The Underfloor trunking system, IMQ mark, for raised floors, consists of 90 x 60 mm single compartment trunkings which can be transformed into double compartments trunking using an appropriate separator.

Assembly of this system is completely reversible and it can therefore be installed in false ceilings as well as on floors; moreover, thanks to an appropriate vertical bend, the trunkings themselves can be mounted on wall like normal visible trunking.

Appropriate boxes are available for this type of application on wall-mounting trunkings, of modular components (e.g. MCBs from ABB's System pro *M* range) or flush-mounting components (switches, sockets etc.).

Junction boxes

ABB offers various types of boxes: in Silumin, the Metal series and the Multiplast box system.

Depending on the version, these boxes can be combined with the Scattoplast system and ABB's floor boxes to implement a completely functional plant which mirrors the growing need for flexibility.

Floor boxes

The range presented by ABB is very wide and rich so that any type of plant can be installed, fulfilling the practical and aesthetic demands of the end client and satisfying the most evolved plant requirements at the same time. The range consists of 5 different types of floor boxes:

- Lusy **NEW**
- Concept
- Telec
- Multivert
- Undernet **NEW**

Floor trunking systems

Underfloor system

General

An extremely innovative concept, the Underfloor system goes far beyond the usual underfloor systems and is primarily orientated towards a structural integration logic within the building.

Designed for raised floor applications, the system has several accessories which greatly extends the application potential; the assembly of this system is completely reversible and therefore enables its installation also in false ceilings.

An appropriate vertical bend also allows the use of Underfloor for

wall-mounting external trunking, following from the floor or ceiling versions.

We are talking, therefore about a system which is extremely versatile and which completely and safely satisfies the distribution of energy to all the plant.

On the visible wall-mounting Underfloor trunkings it is possible to mount electrical devices, directly, using the appropriate boxes. Depending on the type of box, modular components such as MCBs (e.g. System pro *M* devices from ABB SACE), up to a maximum of 4 modules, or modular flush-mounting devices up

Floor trunking systems

Underfloor system

to a maximum of 4 sockets (for example the IDEA VIMAR Series). The trunkings are made of PVC and the accessories of ABS, both are in RAL 7035 grey.

The installations implemented using the Underfloor system can be inspected at any time without any problem, since both the trunkings and the connection accessories are furnished with removable covers which can be detached using tools; it is therefore possible to enter into any point of the plant without involving any part not directly concerned in the intervention itself. This characteristic is particularly useful in the case of modifications, ins-

pections and local maintenance. Protection degree is IP40. Boxes and trunkings conform to CEI 64-8 and CEI 23-32V1 Standards, respectively; the system has the IMQ mark.

Underfloor system

Installation criteria

2

Both when dealing with new installations, and when changing existing environments, where the existing floor may be of a limited height, the Underfloor system does not present particular installation problems. For new implementations, where it is possible to use floors of a useful height not less than 210 mm (interspace), there is available a modular junction box art. 10 240 which offers several branch connection on all four sides and allows cross-over of the trunkings.

The modularity of the art. 10 240 box is implemented by couplings on the corners, so that, even in a compound configuration, each box can join with a trunking on each side; each box, therefore, can be used for a particular service: electric, telephonic, data transmission etc.

For restructuring with floors with a minimum useful height of 120 mm (interspace) use instead box art. 10 241, which is lower, and allows a branch connection on one side.

Both the art. 10 240 and art. 10 241 boxes allow branch connections of the trunkings which compose the Scattoplast system to connect with raised floors or the traditional type.

The art. 10 240 boxes are provided with two knockout holes on the two opposite sides, for Scattoplast trunkings 70x30 mm; while art. 10 241 boxes are provided with one knockout hole for Scattoplast trunkings 95x30 mm.

For floors of a useful height, not less than 210 mm (interspace), the cable exit towards external floor boxes is carried out at the junction of two sections of the trunking; this is done using a special type of joint on which it is possible to attach a snap-on secondary branch connection (art. 10 161, can be mounted also on the cover of the trunking). At the junction of the trunkings rests a separator which has a double function: to raise the trunking above the floor and receive the joint, which clips on to the separator.

The trunkings are 95x60 mm and have a single compartment; this, however, can be subdivided into two compartments using an appropriate separator.

Floor trunking systems

Scattoplast system

General

The Scattoplast floor trunking system, in self-extinguishing thermo plastic, is composed of trunkings for laying cables, cable glands that can be snapped onto the trunkings themselves and a group of accessories specially designed to rationalise the distribution paths, in traditional and raised floors.

Junction boxes are also available in self-extinguishing thermo-plastic, suitable both for normal and raised floors, and Silumin alloy boxes. Some of the system's accessories make it possible to create branch connections with flexible and corrugated conduits.

Depending on the type of component the colour may be RAL 9016 white or RAL 1018 yellow.

FLSP0027

Floor trunking systems

Scattoplast system

The main advantages of the Scattoplast system are the speed and economy of installation.

The plants created with Scattoplast components offer maximum safety and satisfy all the current Standards: in particular, the components comply with CEI 64-8 Standard.

Scattoplast trunkings can be connected to Underfloor through junction boxes art. 10 240 and 10 241. The Scattoplast system

can also be easily connected to above-floor ducting (for example skirting board/dado trunking by ABB).

Junction boxes

Silumin boxes

General

Junction boxes in Silumin alloy, suitable for applications in floor distribution systems, can be connected to all trunkings in the Scatoplast system through the bulkheads available. In addition to this possibility the bulkheads can also be used to connect directly to

corrugated conduits (25 or 30 mm diameter).

Silumin boxes are supplied complete with an internal, transparent, plastic separator to divide the various circuits clearly and safely.

The boxes are fitted with screws used to make them level at 10 or 20 mm by a simple adjustment, depending on the article, making

FLSPR003

Junction boxes

Silumin boxes

it possible to adjust the height of the box perfectly to the system's requirements.

The boxes also have a threaded pin (box 270x270x60 mm) or 4 threaded pins (400x400x57 mm) that, once attached to the lid, stop it bending and ensure that the support is even safer when

walked over.

The lid supplied is suitable for use with carpets and linoleum. Brass or aluminium frames can be used to make these surfaces more attractive and lids are also available for floors covered in marble, wood or tiles. The boxes conform to the CEI 64-8 Standard.

Junction boxes

Metal series boxes

General

The Metal boxes, made in Silumin alloy, are suitable for applications of a general type in floor distribution systems.

They are the only boxes fitted with inlets that make it possible to connect both trunkings and corrugated conduits (25 mm diameter) without the use of optional accessories.

The height of the box can range from 50 to 60 mm by means of a simple adjustment to the counter-frame, so that it can be lined up perfectly with the floor.

Metal boxes also allow electricity, telephone and data transmission lines to be kept completely separate from each other; they comply with the Telecom requirements and have been awarded Ministerial type approval ASST n. IT/90/TF/581. They also conform to CEI 64-8 Standard.

Not only are the Metal boxes extremely functional in underfloor sorting and branch connection thanks to the inlets for both trunkings and corrugated conduits, but they can also be connected to Concept, Telec and Lusy floor boxes, as external branch connection terminals.

Junction boxes

Multifunctional Multiplast system

General

The multifunctional Multiplast junction boxes have been specifically designed for installation in raised floors and, compared with other boxes with similar application, have a group of technical features that extend their functions, making it possible, among other things, to fit modular protection devices and modular branch connection devices easily available on the market (Schuko sockets, sockets with a central earth wire and the like).

Type approval: IT/91/TF/034.

FLSP9080

Junction boxes

Multifunctional Multiplast system

Boxes

In the pictures on the previous page you can see removable front and side plates with knockout holes and hollows for connecting corrugated conduits and trunkings.

The removable plates fitted with knockout inlets can be replaced by accessories that extend the functions of the box, for example:

- support mounting plate for three modular sockets (e.g. Vimar 8000/Idea) and for two Schuko socket combinations of the BUSCH-E 2000 series by ABB SACE; the frame is fitted on the shorter side of the box
- mounting plate with knockout holes for fitting EDP connectors (Canon, BNC co-axial, IBM etc.); the plate can be fitted on the shorter side of the box
- mounting plate for fitting telephone sockets, Schuko sockets in the BUSCH-E-2000 series by ABB SACE and other modular sockets (maximum 2 units) easily available on the market; the plate can be fitted instead of one of the two input plates on the longer side of the box.

The base of the box has been designed with five grooves so that DIN rails (for modular equipment) and terminal boards can be fitted, using self-tapping screws.

The boxes are made in self-extinguishing technopolymer with IP 52 protection degree, in RAL 1018 yellow; the lid is snap-on fitting with 4 screws.

It is possible to combine the distribution of electricity and services (telephones, EDP, auxiliaries) by using more than one multifunctional box and by separating the internal compartments.

Floor boxes and desk service units

Lusy floor boxes

General

The new Lusy floor boxes presented by ABB perfectly integrate with distribution systems and can accommodate electrical sockets from all the main manufacturers on the market, satisfying the requirements of the most demanding designer and installer.

The box has been designed so that it can be easily combined with the Scattoplast and Underfloor distribution systems both for traditional and for raised floors; it can also be used with trunkings for above-floor installation.

Many underfloor connection possibilities are given: to cable glands using ring nuts, to junction boxes (Metal series) via bases, by attaching the bases directly to the floor. All designed for easy, rapid and convenient installation.

Plastic component are made in ABS; colour RAL 7021 darkgrey.

The front of the box can accommodate devices at a variable angle and this is a considerable advantage for the user when inserting plugs. Designed for the installation of devices on one side only, the Lusy boxes have lateral modularity, even with opposite devices. Up to a maximum of three boxes can be installed side

FLSP0008

Floor boxes and desk service units

Lusy floor boxes

by side, for inter-axes of 118 mm and 124 mm and up to two floor boxes for an inter-axis of 100 mm.

There are two types of floor boxes: for 2-unit frames and plates and for 4-unit frames and plates of all makes. A very wide flexibility in terms of combinations, therefore, that makes it easier to adapt the plant to the actual requirements of the user. The product also has great mechanical strength so that it has excellent resistance to shocks.

Lusy floor boxes are designed to be fitted with a bulb whose function is to warn of the presence of the box itself; the bulb is of

the standard type used on civil sockets (for example the Vimar bulb art. 10 490). Lusy floor boxes are extremely attractive and this makes them even easier to install in any kind of architecture or interior. Moreover, to guarantee maximum safety all the bases have been fitted with double seals so that there is IP 52 degree of protection between the box and the floor.

They conform with CEI 64-8 Standard.

Floor boxes and desk service units

Concept floor boxes

General

Concept floor boxes have been designed with the maximum attention for all those requirements that make its use safer and more reliable.

For this reason each of the two sides of the tower can accommo-

date up to 4 modular units, making it possible to mount a differential magneto-thermal protection alongside each socket (including Schukos). Sockets can also be fitted for the telephone, data processing and auxiliary services; an internal separator keeps the different circuits separate.

Further important characteristics of this type of floor boxes are its

Floor boxes and desk service units

Concept floor boxes

design and its mechanical structure that make it particularly easy to fit.

In fact the cover snaps onto the structure after the equipment has been easily cabled and after the structure itself has been attached to the base using the supplied screws.

Concept floor boxes are made in self-extinguishing technopoly-

mer, a material that guarantees very high safety levels thanks to its specific self-extinguishing characteristics.

Concept towers guarantee IP 54 degree of protection between the base and the floor and conform to CEI 64-8 Standard.

Floor boxes and desk service units

Telec floor boxes

General

Telec floor boxes are highly modular making them suitable for the branch connection of a large number of electrical and telephonic services.

Two different kinds are available, designed respectively for electrical services and telephonic and auxiliary services; both are made in self-extinguishing thermoplastic, fitted with special rubber seals that provide IP 54 degree of protection in the mechanical con-

FLSP910115

Floor boxes and desk service units

Telec floor boxes

nection to the floor.

They conform to CEI 64-8 Standard.

The attractive appearance of the Telec floor boxes means that they can fit harmoniously into different work environments; they

can be used as branch connection terminals with the Scattoplast systems as well as with the Metal and Incaplast series boxes.

Floor boxes and desk service units

Multivert desk service units

General

Multivert desk service units are a handy system for connecting utilities to the respective distribution circuits under the floor; they have an excellent design and, above all, are highly functional.

The body of the tower is, in fact, divided into 4 sections, to serve several work stations, and allows a large number of branch connection, control and protection devices to be installed, according to the specific requirements of the user.

MCBs and other modular components, ABB BUSCH-E 2000 and all types of modular electric sockets on the market (for example, Vimar IDEA series) can be inserted as well as the various connectors for EDP and telematic services.

Each of the 4 sectors making up the desk service unit can be equipped according to the actual needs of the work post it serves; moreover, because it has been designed to accommodate MCBs, each unit can be fitted with the appropriate system protections for the work stations with which it is combined.

If necessary, this makes it possible to switch the power supply to the utilities on and off, without having to use centralised electrical control panels.

Floor boxes and desk service units

Multivert desk service units

Technological and application characteristics

The functions of each work post can be personalised by mounting various types of modular panels onto the tower depending on the requirements (3 panels for each enabled side).

In addition to the panels already available, the user can also ask for panels to be perforated according to specific needs.

All the materials selected for the desk service unit components have been carefully selected.

The wiring accessories panels are made in extruded anodised aluminium, the bases and covers are in di-cast anodised aluminium. The cover is in technopolymer, a material that is without halogens and with a self-extinguishing level of UL 94-V0.

The base is fitted with a special rubber seal that gives IP 54 degree of protection to the mechanical connection of the desk service unit with the floor.

Multivert desk service units can be combined with the Scatto-plast system, both in raised and traditional floors, and to the Underfloor system.

Multivert desk service units conform to CEI 64-8 Standard.

Floor boxes and desk service units

Undernet floor boxes

General

Undernet floor boxes are suitable for installation in floors or false ceilings and for traditional installations (using a special, flush-mounting metal box). Cables are input through knockouts and rubber cable-ways which prevent direct stress to the devices.

In spite of the small size of these boxes, circuits are separated and any kind or make of device can be connected. The boxes are available in two models that can contain, respectively, 10 or 16 of

the new generation devices on the market.

Available with two types of covers, an empty one onto which carpet or linoleum can be applied (5 mm deep) and one finished in square-patterned stainless steel, the new boxes fit into any style of décor. Undernet floor boxes do not hinder the free movement of people in a room and make it easier to change the lay-out of offices. Thanks to the design of the supports for devices that are slightly angled at 15°, it is even simpler and easier to connect utilities. The cover, that can be easily removed for cabling purpo-

FLSP9148

Floor boxes and desk service units

Undernet floor boxes

ses, can be opened with a tool and closes on its own (in compliance with CEI 64-8 Standards) to prevent danger to the movement of people.

IP 52 degree of protection between the box and the floor is ensured by a safety seal that also makes installation faster and safer for the technician; IP 4X is the degree of protection on the edge of the cover and IP 2X at the point where the cables enter. The cover has a resistance of over 1500 N under DIN VDE 0364 Standards. The RAL 7021 darkgrey-coloured floor boxes are made in

self-extinguishing technopolymer with high safety levels and are resistant to the chemical agents present in the main detergents on the market. Solidly and strongly built in every detail, they can be reliably used for all types of devices even in very severe operating conditions.

Systems for light prefabrication

General aspects and installation criteria

Components for light prefabrication can be inserted in light walls (plaster panels, masonite etc.); they are made in self-extinguishing thermoplastic.

Vimar IDEA and 8000 series devices and ABB BUSCH-E 2000 devices can be applied together with the installation systems for prefabricated building.

In self-extinguishing material with IP 30 degree of protection for insertion into panels from 7 to 35 mm thick.

Systems for prefabricated buildings

Incaplast boxes for distribution in prefabricated buildings

General

Incaplast boxes have been specifically designed for floor distribution systems using Predalle type prefabricated floor slabs.

They are made in self-extinguishing thermoplastic and are highly resistant.

Incaplast boxes are easy and fast to install; they can be assembled in multiple combinations using snap-on couplings so that the various services (electricity, telephone and auxiliary lines etc.) can be installed separately.

Floor boxes in the Telec series can be combined with Incaplast boxes.

IP degree of protection

Protection against the penetration of solid bodies

1 st digit: protection from solid bodies		
IP		
0		Unprotected
1		Protected against solid bodies larger than 50 mm (unintentional contact with the hands)
2		Protected against solid bodies larger than 12 mm (finger)
3		Protected against solid bodies larger than 2.5 mm (tools, wires)
4		Protected against solid bodies larger than 1.0 mm
5		Dust proof (no harmful deposit)
6		Totally dust proof

1st digit defined by CEI 70-1 – IEC 529 – IEC 144 Standards

2 nd digit: protection from liquids		
IP		
0		Unprotected
1		Protected against vertical drops of water (condensation)
2		Protected against drops of water falling with a maximum angle of 15°
3		Protected against drops of water falling with a maximum angle of 60°
4		Protected against sprays of water from all directions
5		Protected against jets of water from all directions from a hose
6		Protected against all projections of water similar to waves
7		Protected against the effects of immersion
8		Protected against the effect of submersion

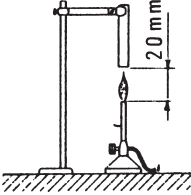

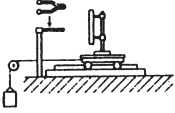

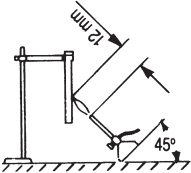

2nd digit defined by CEI 70-1 – IEC 529 – IEC 144 Standards

Technical details

Definition of IP degree of protection

Protection from the penetration of solid bodies			Protection against the penetration of water		
1 st characteristic digit	Brief description	Full description	2 nd characteristic digit	Brief description	Full description
0	Unprotected	No particular protection is provided	0	Unprotected	No protection is provided
1	Protected against solid bodies larger than 50 mm	It must be impossible for a large surface area, for example, the hand, to penetrate (voluntary protection is not provided, however) or solid bodies larger than 50 mm in diameter	1	Protected against drops of water	Vertically-falling drops of water must not cause damage
2	Protected against solid bodies larger than 12 mm	It must be impossible for the fingers or similar objects with a maximum length of 80 mm or solid bodies with a diameter greater than 12 mm, to penetrate	2	Protected against drops of water falling with a maximum angle of 15°	Vertically-falling drops of water will not cause damage when angled at a maximum of 15° from vertical
3	Protected against solid bodies larger than 2.5 mm	It must be impossible for tools, wires, etc. with a diameter or thickness greater than 2.5 mm or solid bodies with a diameter greater than 2.5 mm to penetrate	3	Rain proof	Rain water falling from a direction creating a maximum angle of 60° from vertical must not cause damage
4	Protected against solid bodies larger than 1.0 mm	It must not be possible for wires or plates with a thickness greater than 1.0 mm or solid bodies with a diameter greater than 1.0 to penetrate	4	Protected against sprays of water	Water sprayed onto the covering from any direction must not cause damage
5	Dust proof	Not totally dust proof, but the quantity that penetrates is not such as to prevent the material from functioning well	5	Protected against jets of water	Water projected with a nozzle from all directs must not cause damage
6	Totally dust proof	No dust can penetrate	6	Protected against waves	In the case of waves or powerful water jets must not penetrate the covering in harmful quantities
			7	Protected against the effects of temporary immersion	Harmful quantities of water must not penetrate inside the immersed covering in specific conditions of pressure or duration
			8	Protected against the effect of continuous immersion	The material is suitable to remain constantly immersed in water in the conditions specified by the manufacturer

Definition of self-extinguishing levels

TEST	TEST EQUIPMENT	COMPLIANCE TO STANDARDS	PURPOSE OF THE TEST	RESULTS OF THE TEST	TEST CONDITIONS		
					Heat source	Duration of test	Characteristic elements
UL (UNDERWRITERS' LABORATORIES)		UL 94	A classification is given to the various types of behaviour that the materials may have following contact with the Bunsen flame	<ul style="list-style-type: none"> • V0 if the test specimen burns for less than 5 seconds before going out • V1 if it burns for less than 25 seconds • V2 if it burns for less than 25 seconds, dripping glowing material • HB if it burns for more than 25 seconds (horizontal test specimen with a maximum burning speed of 38 mm per minute). Can be assimilated with ASTM D-635 	Bunsen burner flame	Flame applied for 10 seconds and for two consecutive times	Duration of combustion
GLOW WIRE (GLOW-WIRE TEST)		IEC 695-2-1 CEI 50-11	Simulates the types of thermal stress that may be produced by the sources of heat or ignition (glowing elements or overcharged resistors for short periods) in order to assess the danger of fire using this simulation	<p>Any manifestation of the flame must cease within 30 seconds of removing the glow wire</p> <p>TEST TEMPERATURES</p> <ul style="list-style-type: none"> • 650 °C • 750 °C • 850 °C • 960 °C 	Glow wire 4 mm in diameter	Wire applied for 30 seconds	Time taken by the flame to go out
FLAME TEST WITH NEEDLE		IEC 695-2-1 CEI 50-11	Simulates the effect of small flames that can occur as a result of faulty conditions inside the product with the aim of judging the risk of fire	<ul style="list-style-type: none"> • The specimen does not catch fire • The flame and the glowing particles do not propagate fire • Combustion lasts less than 30 seconds 	Bunsen burner flame	Flame applied for the time (Ta) 5, 10, 20, 30, 60, 120 seconds depending on the particular standards.	The level of severity: flame application time (Ta)

Form for ordering Scattoplast drilled trunkings

Index

Form for ordering Scattoplast drilled trunkings	9/2
-------------------------------------------------------	-----

Form for ordering Scattoplast drilled trunkings

On request trunkings can be supplied with holes for housing bulkheads. In this way the branch connection of cables is even easier.

Using the following diagram, please indicate the article selected, the number of pieces to be drilled, the distance from the extremity of the trunking and the distance between the holes.

The diameter of the hole is 47 mm.

- 1) Please photocopy the page at the side
- 2) Fill it in
- 3) Send it via fax or deliver it to your retailer together with the order

Metal series boxes (for 70 x 30 mm trunkings) and Multiplast multifunction boxes (for 70 x 30 mm and 95 x 30 mm trunkings) can be connected to the Scattoplast system.

Holes at a constant distance

Complete every column with the data in mm

Article

Quantity

Variable distance holes

The following measurements in mm are needed:
- inter-axis distance of the first hole from the extremity of the trunking
- inter-axis between every individual hole and the next one
