What's New Machining PowerPac 5.12.02

New Features

Existing Solutions Are Added as Configuration Templates in Wizard

If a solution is created, its configuration will become an template option in the first page of wizard. This can help users to create solutions based on previous configuraitons.

Copy/Apply Targets' Orientation in Path View

Duplicate the basic functions "Copy Orientation" and "Apply Orientation" from RobotStudio into Path View. Thus users needn't switch tabs between 'Home' and 'Machining' for these functions.

More Indication Choices of Tool and Robot for Path View

Duplicate the basic functions "View Tool at Target" and "View Robot at Target" from RobotStudio into Path View. Thus users have more choices for target indicators besides the original dummy tool (i.e. face working tool and side working tool).

Improved Comments in CalibData Module

Add comments for the calibration function in the RAPID module, explaining the basic method of how calibration works.
